

Chlorine – Easy Start-Up Directions

NOTE: Any time a chemical is added, make sure that the water is at least 80 degrees, the jets/pumps are on, and leave the lid in the open position for 30 minutes to an hour. Many chemicals use gallons as a dosage guideline. Having a spa care chart is a great way to keep track of how the usage affects the water quality and chemicals, and will provide a guide to help establish a regime.

- 1) Test the water. This provides an idea of the quality of water from the initial startup.
 - 2) Add Ph Up or Ph Down as needed to stabilize the Ph.
 - 3) Add Chlorine (in accordance with the directions on the bottle) to establish and maintain the recommended amount of chlorine. Chlorine is the sanitizer. It will need to be added frequently and directly relates to how much the spa is being used.
 - 4) Shock "oxidizer" assists in keeping the water clear. Add shock at start up and once or twice a week depending on usage.
- Continue to test the water regularly (minimum of once a week). Maintain the correct balance of alkalinity, PH and chlorine. Keep the filters cleaned regularly and in accordance with the usage.
